

DSAINTE Business Model Overview

Distributed Sovereign AI Infrastructure Nodes Technology

Infrastructure-as-a-Platform (IaaS)

Business Model Overview

DSAINTE is a European infrastructure initiative that develops, owns, and operates distributed sovereign AI infrastructure nodes designed to support artificial intelligence, high-performance computing, cloud services, research computing, and future digital applications.

Unlike traditional AI companies that primarily generate value through software, algorithms, or ownership of AI hardware, DSAINTE focuses on long-term ownership and operation of critical infrastructure assets.

The DSAINTE business model is built around Infrastructure-as-a-Platform (IaaS), providing secure, resilient, and sustainable environments where customers can deploy and operate advanced computing systems.

Core Business Principle

DSAINTE owns and operates the infrastructure.

Customers own and operate the computing equipment.

This approach separates long-life infrastructure assets from rapidly depreciating technology assets, creating a more stable and scalable business model.

DSAINTE Owns

- Land
- Buildings
- Electrical Infrastructure
- Cooling Infrastructure
- Security Infrastructure
- Connectivity Infrastructure
- Operations & Maintenance

Customers Provide

- GPUs
- AI Accelerators
- Servers

- Storage Systems
 - Cloud Platforms
 - AI Applications
 - Research Workloads
-

Value Proposition

DSAINTE provides customers with:

Secure Infrastructure

- Tier III architecture
- Dual-perimeter security
- Redundant systems
- Sovereign hosting environments

Sustainable Operations

- Direct-to-chip liquid cooling
- BTES geothermal energy storage
- Waste heat recovery opportunities
- Low PUE targets

Strategic Locations

- Regional infrastructure nodes
- Reduced concentration risk
- Improved resilience
- Expansion-ready sites

Long-Term Stability

- Infrastructure ownership model
 - Professional operations
 - Predictable service environment
 - Scalable capacity growth
-

Revenue Streams

Infrastructure Leasing

Leasing of:

- Rack space
- Private suites
- Dedicated halls
- Expansion areas

Revenue Model:

Recurring monthly contracts.

AI Infrastructure Hosting

Provision of:

- Power
- Cooling
- Physical security
- Connectivity
- Operational support

Revenue Model:

Capacity-based recurring fees.

Sovereign Cloud Infrastructure

Future service offerings:

- Private cloud environments
- Enterprise cloud infrastructure
- Government cloud environments

Revenue Model:

Subscription and service agreements.

Research Infrastructure Partnerships

Partnerships with:

- Universities
- Research institutes
- Innovation centers

Revenue Sources:

- Research contracts
 - Infrastructure partnerships
 - Innovation programs
-

Enterprise Infrastructure Services

Support for:

- Industrial AI
- Digital twins
- Simulation workloads
- Advanced analytics

Revenue Model:

Long-term enterprise agreements.

Connectivity Services

Provision of:

- Carrier-neutral access
- Fiber infrastructure
- Dedicated network services

Revenue Model:

Connectivity and transport fees.

Sustainability Services

Future opportunities include:

- Waste heat utilization
- District heating partnerships
- Energy optimization programs

Revenue Model:

Infrastructure and utility partnerships.

Customer Segments

Public Sector

- Municipalities
 - Regional governments
 - Public institutions
-

Research & Education

- Universities
 - Research organizations
 - Innovation hubs
-

Enterprise Customers

- Manufacturing companies
 - Industrial groups
 - Technology firms
 - Digital service providers
-

AI & Cloud Providers

- AI startups
 - Cloud operators
 - HPC providers
 - Infrastructure companies
-

Competitive Advantages

Distributed Architecture

Unlike hyperscale concentration models, DSAINT develops a geographically distributed infrastructure network.

Benefits:

- Improved resilience
 - Reduced concentration risk
 - Regional economic development
-

Infrastructure Ownership

Focus on long-life assets:

- Land
- Buildings
- Utilities
- Connectivity

Benefits:

- Stable asset base
 - Reduced technology obsolescence risk
 - Long-term value creation
-

Sustainability

Integrated from the beginning through:

- Geothermal BTES systems
 - Direct-to-chip cooling
 - Heat recovery opportunities
 - Energy-efficient design
-

European Digital Sovereignty

Supports:

- European infrastructure ownership
 - Secure hosting environments
 - Strategic digital independence
-

Demonstrator Node 01

Location

Bedburg-Hau, Germany

Initial Capacity

2 MW IT Load

Expansion Capacity

Up to 6 MW

Estimated Investment

Approximately €43 Million

Estimated Annual OPEX

Approximately €6.5 Million

Operating Model

Infrastructure Ownership and Operations

Growth Strategy

Phase 1 (2026–2030)

Demonstrator Node 01

Bedburg-Hau, Germany

Phase 2 (2030–2033)

Expansion to 3 German Nodes

Phase 3 (2033–2036)

Expansion to 6 German Nodes

Phase 4 (2036–2040)

Expansion to 10+ European Nodes

Target Regions:

- Germany
 - Benelux
 - Central Europe
 - Scandinavia
 - Southern Europe
-

Long-Term Vision

DSAINTE aims to become a leading European infrastructure platform supporting artificial intelligence, cloud computing, research, and advanced digital services through a resilient network of sovereign AI infrastructure nodes.

By combining infrastructure ownership, sustainability, operational excellence, and regional development, DSAINTE seeks to build the physical foundation of Europe's AI future.

DSAIN

Distributed Sovereign AI Infrastructure Nodes Technology

Securing Europe's Digital Future Through Distributed AI Infrastructure

Secure • Sovereign • Scalable • Sustainable
